Lecture 11: Testing of Feature Interactions

Gregory Gay
TDA 594/DIT 593 - December 6, 2022

Creating Test Cases

Test Specifications

- **May end up with thousands of test specifications.**
- Which do you turn into concrete test cases?
- **Identify the important interactions.**

Today's Goals

- Examine how feature interactions can create faults.
- Examine **how to select system tests** to increase likelihood of detecting interaction faults.
 - Category-Partition Method
 - Combinatorial Interaction Testing

Feature Interactions

- Features are expected to interact.
 - Usually this is planned!
 - Sometimes unplanned interactions break the system.
 - **We should select tests that thoroughly test feature interactions.**

Feature Interactions

- **Feature interactions** result from combining **values** of individual **choices**.
 - **Inadvertent interactions** cause unexpected behavior
 - (ex. incorrect output, timing)
- Want to detect, manage, resolve inadvertent interactions.

Fire and Flood Control

- FireControl activates sprinklers when fire detected.
- FloodControl cuts water supply when water detected on floor.
- **Interaction means building burns down.**

WordPress Plug-Ins

[`:weather:`]

WORDPRESS

:) 8-) ;-) ...

Today's weather: [`:weather:`🕶️]

- Weather and emoji plug-ins tested independently.
- Their interaction results in unexpected behavior.

Feature Interactions

Unit test vs. Integration test

Selecting Test Specifications

- We want to select *interesting* specifications.
- **Category-Partition Method**
 - Apply **constraints** to reduce the number of specifications.
- **Combinatorial Interaction Testing**
 - Identify a subset that covers all **interactions between pairs of choices**.

Category-Partition Method

Category-Partition Method

Creates a set of test specifications.

- **Choices, representative values, and constraints.**
 - **Choices:** What you can control when testing.
 - **Representative Values:** Logical options for each choice.
 - **Constraints:** Limit certain combinations of values.
- Apply more constraints to further limit set.

Identify Choices

- Examine parameters of function.
 - *Direct input, environmental parameters (i.e., databases), and configuration options.*
- Identify characteristics of each parameter.
 - What aspects influence outcome? (**the choices**)
- **Choices** are also called ***categories*** if you look up category-partition method.

Example - Set Functions

- Small function library related to Sets:
 - `void insert(Set set, Object obj)`
 - `Boolean find(Set set, Object obj)`
 - `void delete(Set set, Object obj)`
- We want to write tests for these three functions.

Example - Set Functions

```
void insert(Set set, Object obj)
```

Identify an Independently
Testable Function

- What are our choices?

Identify Choices

```
@Test
public void testInsert() {
    // Set up the existing set,
    // either empty or with
    // existing items
    Set target = new Set(...);
    // Insert an object
    insert(target, ...);
    // Check the result
    assert...
}
```

- **Parameter: set**
 - **Choice 1:** How many items are in the set? (performance may degrade with larger sets)
- **Parameter: obj**
 - **Choice 2:** Is obj already in the set?
 - **Choice 3:** Is the object valid? (e.g., not null)?

Identify Representative Values

- Many values can be selected for each choice.
- Partition each choice into *types of values*.
 - Consider all outcomes of function.
 - Consider logical ranges or groupings.
- A test specification is a selection of values for all choices.
 - Concrete test case fills values for each abstract selection.

The image shows a large table with 10 columns and 100 rows. Each cell in the table contains a small circle. Some circles are filled (black), while others are empty (white). The pattern of filled circles varies across the rows and columns, representing a specific data set or test specification. The table is organized into four main groups of four columns each, labeled with letters A, B, C, and D at the top. The rows are numbered 1 through 100 on the left side. The filled circles are distributed in a way that suggests a systematic or random selection process, likely representing the 'concrete test case' mentioned in the text.

Example - Set Functions

```
void insert(Set set, Object obj)
```

**Identify Representative
Input Values**

Parameter: set

- **Choice:** How many items are in the set?
 - **Representative Values:**
 - Empty Set
 - Set with 1 item
 - Set with 10 items
 - Set with 10000 items

Parameter: obj

- **Choice:** Is the object already in the set?
 - **Representative Values:**
 - obj already in set
 - obj not in set
- **Choice:** Is the object valid?
 - **Representative Values:**
 - Valid obj
 - Null obj

Generate Test Case Specifications

- Test specification = selection a values for each choice.
- **Constraints** limit number of specifications.
 - Eliminate impossible pairings.
 - Remove unnecessary options.
 - Choose a subset to turn into concrete tests.

7776 tests (all combinations)

40 tests (after constraints)

Example - Set Functions

Generate Test Case Specifications

Set Size	Obj in Set	Obj Status	Outcome
Empty	Yes	Valid	No change
Empty	Yes	Null	Error
Empty	No	Valid	Obj added to Set
Empty	No	Null	Error
1 item	Yes	Valid	No change
1 item	Yes	Null	Error
1 item	No	Valid	Obj added to Set
1 item	No	Null	Error
10 items	Yes	Valid	No change
10 items	Yes	Null	Error
10 items	No	Valid	Obj added to Set
10 items	No	Null	Error

```
void insert(Set set,
Object obj)
```

- $(4 * 2 * 2) = 16$ specifications
- Each can become 1+ tests.
- Use constraints to remove impossible combinations.

Set Size	Obj in Set	Obj Status	Outcome
10000	Yes	Valid	No change (may be slowdown)
10000	Yes	Null	Error
10000	No	Valid	Obj added to Set(may be slowdown)
10000	No	Null	Error (may be slowdown)

Constraints Between Values

- IF-CONSTRAINT
 - This value only needs to be used under certain conditions
(if **X is true**, use value **Y**)
- ERROR
 - Value causes error regardless of values of other choices.
- SINGLE
 - Only a single test with this value is needed.
 - Corner cases that should give “good” outcome.

Example - Substring

`substr(string str, int index)`

Choice: Str length

length = 0 property zeroLen, TRUE if length = 0

length = 1

length >= 2

Choice: Str contents

contains letters and numbers if !zeroLen

contains special characters if !zeroLen SINGLE

empty if zeroLen

Choice: index

value < 0 ERROR

value = 0

value = 1

value > 1

Example - Set Functions

```
void insert(Set set, Object obj)
```

Identify Constraints

Parameter: set

- **Choice:** How many items are in the set?

- **Representative Values:**

- Empty Set property empty
- Set with 1 item
- Set with 10 items single
- Set with 10000 items single

Parameter: obj

- **Choice:** Is the object already in the set?

- **Representative Values:**

- obj already in set if !empty
- obj not in set

- **Choice:** Is the object valid?

- **Representative Values:**

- Valid obj
- Null obj error

Example - Set Functions

Apply Constraints

Set Size	Obj in Set	Obj Status	Outcome
Empty	Yes	Valid	No change
Empty	Yes	Null	Error
Empty	No	Valid	Obj added to Set
Empty	No	Null	Error
1 item	Yes	Valid	No change
1 item	Yes	Null	Error
1 item	No	Valid	Obj added to Set
1 item	No	Null	Error
10 items	Yes	Valid	No change
10 items	Yes	Null	Error
10 items	No	Valid	Obj added to Set
10 items	No	Null	Error

```
void insert(Set set,
Object obj)
```

$(4 * 2 * 2) = 16$ specifications

Can't already be in empty set, - 2

error (null), - 6

single (10, 10000), - 2

Set Size	Obj in Set	Obj Status	Outcome
10000	Yes	Valid	No change (may be slowdown)
10000	Yes	Null	Error (may be slowdown)
10000	No	Valid	Obj added to Set(may be slowdown)
10000	No	Null	Error (may be slowdown)

Example - Set Functions

Apply Constraints

Set Size	Obj in Set	Obj Status	Outcome
Empty	No	Valid	Obj added to Set
Empty	No	Null	Error
1 item	Yes	Valid	No change
1 item	No	Valid	Obj added to Set
10 items	No	Valid	Obj added to Set
10000	No	Valid	Obj added to Set(may be slowdown)

```
void insert(Set set,  
Object obj)
```

- From 16 -> 6 specifications
- Each can become 1+ tests.
- Can further constrain if needed.

Example - Set Functions

`void insert(Set set, Object obj)`

Create Test Cases

Set Size	Obj in Set	Obj Status	Outcome
Empty	No	Valid	Obj added to Set

Set Size	Obj in Set	Obj Status	Outcome
Empty	No	Null	Error

```
@Test
public void testInsertEmptyValid() {
    // Set up the existing set
    Set target = new Set();
    // Insert an object
    String obj = "Test";
    insert(target, obj);
    // Check the result
    assertTrue(find(target,obj));
}
```

```
@Test
public void testInsertemptyNull() {
    // Set up the existing set
    Set target = new Set();
    // Insert null object and check exception
    Throwable exc = assertThrows(
        SetException.class, () -> {
            insert(target, null); });
    assertEquals("Null Object", exc.getMessage());
}
```

Activity - find service

`find(pattern,file)`

- Finds instances of a pattern in a file
 - `find("john",myFile)`
 - Finds all instances of john in the file
 - `find("john smith",myFile)`
 - Finds all instances of john smith in the file
 - `find("“john” smith",myFile)`
 - Finds all instances of “john” smith in the file

Activity - find Service

- Parameters: pattern, file
- What can we vary for each?
 - What can we control about the pattern? Or the file?
- What values can we choose for each choice?
 - **File name:**
 - File exists with that name
 - File does not exist with that name
- What constraints can we apply between choice values? (if, single, error)

Let's take a break.

Example - find Service

Pattern:

$(2^2 * 3^3 * 4^1) = 108$ test specifications

- Pattern size:
 - Empty
 - single character
 - many characters
 - longer than any line in the file
- Quoting:
 - pattern has no quotes
 - pattern has proper quotes
 - pattern has improper quotes (only one “)
- Embedded spaces:
 - No spaces
 - One space
 - Several spaces

File:

- File name:
 - Existing file name
 - no file with this name
- Number of occurrence of pattern in file:
 - None
 - exactly one
 - more than one
- Pattern occurrences on any single line line:
 - One
 - more than one

ERROR and SINGLE Constraints

$$4 \text{ (error)} + 2 \text{ (single)} + (1^2 * 2^3 * 3^1) = 30$$

- Pattern size:

[error]

- Empty
- single character
- many character

[error]

- longer than any line in the file

- Quoting:

- pattern has no quotes
- pattern has proper quotes

[error]

- pattern has improper quotes (only one “)

- Embedded spaces:

- No spaces
- One space
- Several spaces

- File name:

- Existing file name
- no file with this name [error]

- Number of occurrence of pattern in file:

- None
- exactly one [single]
- more than one

- Pattern occurrences on target line:

- One
- more than one [single]

IF Constraints

$$4 \text{ (error)} + 2 \text{ (single)} + (1^3 \cdot 2^3) \text{ (quoted = true)} + (1^4 \cdot 2^2) \text{ (quoted = false)} = 18$$

- Pattern size:

[error]

- Empty
- single character
- many character

[error]

- longer than any line in the file

- Quoting:

- pattern has no quotes

[property quoted]

- pattern has proper quotes

[error]

- pattern has improper quotes (only one “)

- Embedded spaces:

- No spaces

[if quoted]

- One space

[if quoted]

- Several spaces

- File name:

- Existing file name
- no file with this name [error]

- Number of occurrence of pattern in file:

- None
- exactly one [single]
- more than one

- Pattern occurrences on target line:

- One
- more than one [single]

Combinatorial Interaction Testing

Limiting Num. of Test Specifications

Bandwidth Mode	Language	Fonts
Desktop Site	English	Standard
Mobile Site	French	Open-Source
Text Only	German	Minimal
	Swedish	
Advertising	Screen Size	
No Advertising	Phone	
Targeted Advertising	Tablet	
General Advertising	Full Size	
Minimal Advertising		

- Full set = 432 specifications
- Few natural IF, SINGLE, ERROR constraints for these features.
- What is important to cover?

Combinatorial Interaction Testing

- Cover all 2-way (pairwise) interactions.
 - **Can cover multiple pairs with one test case.**
- Set of all combinations grows exponentially.
- Set of pairwise combinations grows logarithmically.
 - (last slide) 432 combinations.
 - Possible to cover all **pairs of choices** in 16 tests.

Example - Paragraph Effects

Paragraph spaces has two values: **selected** and **unselected**.
Mirror indents has two values: **selected** and **unselected**.
And finally, line spacing has three values: **single**, **multiple** and **double**.

Paragraph Space

☐ Don't add space between paragraphs of the same style

Indentation

☐ Mirror Indents

Line Spacing

Single

Paragraph Space	Indentation	Line Spacing
Selected	Selected	Single
Unselected	Unselected	Double
		Multiple

**2 * 2 * 3 = 12
combinations**

Example - Paragraph Effects

Single	Indent Selected	Paragraph Selected
Single	Indent Unselected	Paragraph Selected
Single	Indent Selected	Paragraph Unselected
Single	Indent Unselected	Paragraph Unselected
Multiple	Indent Selected	Paragraph Selected
Multiple	Indent Unselected	Paragraph Selected
Multiple	Indent Selected	Paragraph Unselected
Multiple	Indent Unselected	Paragraph Unselected
Double	Indent Selected	Paragraph Selected
Double	Indent Unselected	Paragraph Selected
Double	Indent Selected	Paragraph Unselected
Double	Indent Unselected	Paragraph Unselected

Single	Indent Selected	Paragraph Selected
Single	Indent Unselected	Paragraph Selected
Single	Indent Selected	Paragraph Unselected
Single	Indent Unselected	Paragraph Unselected
Multiple	Indent Selected	Paragraph Selected
Multiple	Indent Unselected	Paragraph Selected
Multiple	Indent Selected	Paragraph Unselected
Multiple	Indent Unselected	Paragraph Unselected
Double	Indent Selected	Paragraph Selected
Double	Indent Unselected	Paragraph Selected
Double	Indent Selected	Paragraph Unselected
Double	Indent Unselected	Paragraph Unselected

Single	Indent Selected	Paragraph Selected
Single	Indent Unselected	Paragraph Selected
Single	Indent Selected	Paragraph Unselected
Single	Indent Unselected	Paragraph Unselected
Multiple	Indent Selected	Paragraph Selected
Multiple	Indent Unselected	Paragraph Selected
Multiple	Indent Selected	Paragraph Unselected
Multiple	Indent Unselected	Paragraph Unselected
Double	Indent Selected	Paragraph Selected
Double	Indent Unselected	Paragraph Selected
Double	Indent Selected	Paragraph Unselected
Double	Indent Unselected	Paragraph Unselected

Example - Paragraph Effects

- Goal of CIT is to produce **covering array**.
 - Set of configurations that covers all 2-way combinations.
 - Cover in 6 test cases.

Single	Indent Selected	Paragraph Selected
Single	Indent Unselected	Paragraph Unselected
Multiple	Indent Selected	Paragraph Selected
Multiple	Indent Unselected	Paragraph Unselected
Double	Indent Selected	Paragraph Unselected
Double	Indent Unselected	Paragraph Selected

Example - Website Display

Text Only	Open-Source	Phone
Text Only	Minimal	Tablet

- Cover all combinations for two variables.
- Add a third, account for all combinations of pairs of values.
 - Each test specification can cover up to three pairs.

Example - Web

Bandwidth Mode	Language	Fonts
Desktop Site	English	Standard
Mobile Site	French	Open-Source
Text Only	German	Minimal

Activity - Browser Configuration

Choices and Representative Values

Allow Content to Load	Notify About Pop-Ups	Allow Cookies	Warn About Add-Ons	Warn About Attack Sites	Warn About Forgeries
Allow	Yes	Allow	Yes	Yes	Yes
Restrict	No	Restrict	No	No	No
Block		Block			

- Full set of test specifications = 144
- Create set covering all pairwise value combinations.
 - Hint: Start with two variables with most values. Add one variable at a time.

Activity Solution

Allow Content	Allow Cookies	Pop-Ups	Add-Ons	Attacks	Forgeries
Allow	Allow	Yes	Yes	Yes	Yes
Allow	Restrict	No	No	Yes	No
Allow	Block	No	No	No	Yes
Restrict	Allow	Yes	No	No	No
Restrict	Restrict	Yes	-	-	Yes
Restrict	Block	No	Yes	Yes	No
Block	Allow	No	-	-	Yes
Block	Restrict	-	Yes	No	-
Block	Block	Yes	No	Yes	No

CIT Tools

- Pairwise Independent Combinatorial Testing (Microsoft): <https://github.com/microsoft/pict>
- Automated Combinatorial Testing for Software (NIST):
<https://csrc.nist.gov/projects/automated-combinatorial-testing-for-software>
- .. Many more: <http://www.pairwise.org/tools.asp>

We Have Learned

- Process for deriving system-level tests often results in **too many test specifications**.
- Two methods that **identify important interactions**:
 - **Category-Partition Method**: Use *constraints* to eliminate unnecessary tests.
 - **Combinatorial Interaction Testing**: Identify important *pairs of input values*.

Next Time

- Automated test case generation
- Assignment 4
 - Questions?
