CSCE 747 - Availability Activity Name(s):

You are building a web store that you feel will unseat Amazon as the king of online shops. Your marketing department has come back with figures stating that - to accomplish your goal - your shop will need an **availability** of at least 99%, a **probability of failure on demand** of less than 0.1, and a **rate of fault occurrence** of less than 2 failures per 8-hour work period.

You have recently finished a testing period of one week (seven full 24-hour days). During this time, 972 requests were served to the page. The product failed a total of 64 times. 37 of those resulted in a system crash, while the remaining 17 resulted in incorrect shopping cart totals. When the system crashes, it takes 2 minutes to restart it.

- 1. What is the rate of fault occurrence?
- 2. What is the probability of failure on demand?
- 3. What is the availability?
- 4. What additional information would you need to calculate the mean time between failures?
- 5. Is the product ready to ship? If not, why not?
