

Each assignment is graded over a series of categories. You will be judged on a scale of 1-4 for each criterion, where a 1 corresponds to a 60%, a 2 corresponds to 75%, a 3 corresponds to 90%, and a 4 corresponds to 100%. If there is no work for a criterion or it is clear that even a minimal amount of effort was not put in, you will receive a 0% for that section of the assignment.

The following is a tentative grading rubric for Assignment 2. This may change before final grading, but gives criteria to aim for with your submission.

Peer Evaluation (5%):

Present or not.

Organization (5%):

4	Have a good organization including a logical layout, requirements grouped by similarity, all sections present, requirements formatted to be easily understood, uses good grammar, and has a single voice. No irrelevant data (i.e., made up “satisfaction numbers”).
3	Most sections present, layout mostly logical, and requirements are easily understood. Lacks single voice and has some grammar issues.
2	Missing some sections, illogical layout, and requirements are hard to understand. Lacks a single voice, many grammar issues
1	Missing major sections, layout illogical, and requirements are not readable. Hard to read and understand.

Use Cases (30%):

4	Captures core usage scenarios of BILL system. Present and well formatted diagram. Descriptions are clear. System boundary and actors are clear and correct both in diagram and document.
3	Some mistakes in UC diagram or descriptions. Missing system boundary descriptions or actors incorrect. Internal activities discussed in description.
2	UC is unclear and incorrect in several areas.
1	UC mostly incorrect - for example, specified a GUI without underlying data processing system.

Requirements (30%):

4	All major system functionality captured. Accounts for error cases. Requirements sufficiently complete and detailed enough to implement. Requirements are not contradictory.
3	Most system functionality captured, or error cases are not accounted for. Lacking in detail.
2	Missing some major functionality including, missing error cases, or incorrect descriptions of functionality (not up to date with elicitation). Requirements barely detailed, are ambiguous, or are contradictory.
1	Missing most functionality. Generally unable to determine what system is supposed to do. Lack of detail sufficient to be unable to implement software.

Tests (30%):

4	Major system functionality tested (correct and incorrect input tested), traceability matrix present, test I/O sufficiently detailed, success/failure conditions well-defined, pre/post conditions well-defined.
3	Major system functionality tested (only one condition tested), traceability matrix present, test I/O sufficiently detailed, success/failure conditions and pre/post conditions incorrect or not clearly defined.
2	Missing some functionality tests, traceability matrix present, tests poorly defined.
1	Missing major functionality tests, traceability matrix present, tests poorly defined.

(Traceability matrix missing drops you down 1 level.)
